

MSWL Deployment of Libre Software
Master on libre software
URJC - GSyC/Libresoft
<http://master.libresoft.es>

Jose Gato Luis, Jose Francisco Castro

March 2011

1 Final Practice

After listen the experience of Eduardo Romero the students will have to make a similar exercise. This work will consist in a "complete" study to present to a company that wants to migrate his infrastructures to a libre software environment.

The students will work in pairs and they will have to choose between six different scenarios (companies, public administrations, etc). These different scenarios will show the "realty" of an environment needing to change to a better (libre) alternative.

Each pair of students will write a document to present to the selected company with a complete study of "How to make a Libre Software Deployment and succeed". Each document will contain the next important points:

- Analysys of the software used in the company and the requirements. Ex: "They use a graphical editor because they need to design logos"
- Software costs
- Study of libre software alternatives. For each piece of libre software alternative:
 - Software description
 - Requirements that covers this software
 - Requirements that does not covers and it should be
 - Solutions to mitigate this fails
- New economic plan
- Training plans
- Conclusion
